Caesar cipher

- Replace each letter in the plaintext with a letter found at a fixed shift down the alphabet
- For example, with a shift of 3:
 - D → A
 - E → B

Add WeChat edu_assist_pro

Uryyb Jbeyq!

Vignère Cipher

- Use a different shift for each character position
- A key encodes the shift for each position
- Each character is shifted from A for the matching position
- Key "BEER" means that the first is shifted by one, the second and third by 4 and the fourth by 17
- The key repeats to cover the whole message

Proving Cipher Security

- A "formal definition"
- A cipher defined over $(\mathcal{K}, \mathcal{M}, \mathcal{C})$ is a pair of *efficient* functions (E, D)

$E: \mathcal{K} \times \mathcal{M}$

(We usually

<https://eduassistpro.github.io/>

For some definition

Add WeChat edu_assist_pro

ient".

- Theoreticians usually assume that the adversary is polynomial in the security parameter.
- We will think of it as fast enough to calculate

"Formal" definitions

- A cipher defined over $(\mathcal{K}, \mathcal{M}, \mathcal{C})$ is a pair of *efficient* functions (E, D)

$$E: \mathcal{K} \times \mathcal{M} \rightarrow \mathcal{C}, \quad D: \mathcal{K} \times \mathcal{C} \rightarrow \mathcal{M}$$

(We usually

k, m)

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

"Formal" definitions

- A cipher defined over $(\mathcal{K}, \mathcal{M}, \mathcal{C})$ is a pair of *efficient* functions (E, D)

$$E: \mathcal{K} \times \mathcal{M} \rightarrow \mathcal{C}, \quad D: \mathcal{K} \times \mathcal{C} \rightarrow \mathcal{M}$$

(We usually

k, m)

<https://eduassistpro.github.io/>

- Correctness:

Add WeChat edu_assist_pro

- $\forall m, k: D_k(E_k(m)) = m$

Perfect Secrecy (Shannon 1945)

- An adversary that sees a ciphertext cannot learn anything about the plaintext.

- All plaintexts have the same probability of producing any given ciphertext

- Formally: <https://eduassistpro.github.io/>

$$\forall m_1, m_2, c: \Pr[E_k(m_1)=c] = \Pr[E_k(m_2)=c]$$

Add WeChat edu_assist_pro

- Questions:
 - Can we achieve perfect secrecy?
 - Does it guarantee security?

One Time Pad (Vernam 1919)

- Domain: $\mathcal{M}=\{0,1\}^n$, $\mathcal{C}=\{0,1\}^n$, $\mathcal{K}=\{0,1\}^n$
- For a plaintext m and a key k , $E_k(m)=k\oplus m$
- For a ciphertext c and a key k , $D(c)=k\oplus c$

Assignment Project Exam Help

- Are these efficient? <https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

- Correctness:
 - $D_k(E_k(m)) = D_k(k\oplus m) = k\oplus(k\oplus m) = (k\oplus k)\oplus m = 0\oplus m = m$

Perfect secrecy of OTP

- Recall: $\forall m_1, m_2, c: \Pr[E_k(m_1)=c] = \Pr[E_k(m_2)=c]$

Assignment Project Exam Help

- For every ciphertext c and plaintext m , there is exactly one key $k=c\oplus m$
- Hence for all m and c , $\Pr[E_k(m)=c] = 2^{-n}$
- Because the probability of $E_k(m)=c$ does not depend on m , the cipher has perfect secrecy

<https://eduassistpro.github.io/>

Add WeChat: edu_assist_pro

Limitations

- Long key
 - Any perfectly secure cipher must have long keys
- Malleable **Assignment Project Exam Help**
- Key cannot be **<https://eduassistpro.github.io/>**
 - Class exercise: How would you the key is used more than once? **Add WeChat edu_assist_pro**
- **Perfect secrecy assumes a very weak attacker!!!**

Ciphertext indistinguishability

- A desired property of ciphers
- A cipher is considered secure if no adversary can distinguish messages based on their ciphertexts
- Typically presented as a game between an adversary and a challenger.

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Distinguishability Games

k

Assignment Project Exam Help

- Challenger chooses a random key
- Adversary gets <https://eduassistpro.github.io/> with that key
- Adversary sends two messages to challenger
- Challenger chooses one at random and sends back to adversary
- Adversary wins on a successful guess of the encrypted message

Add WeChat edu_assist_pro

Adversarial models

- Known plaintext attack
 - The adversary learns some pairs of matching plaintexts and ciphertexts
- Chosen plaintext attack
 - The adversary chooses its other choosing
- Chosen ciphertext attack
 - As CPA, but can also decrypt some ciphertexts
- Adaptive chosen ciphertext attack
 - AS CCA, but can base the choices on previous results

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

More attacks

- Side channel attacks
 - The adversary has information on the internal state of the implementation
- Fault injection
 - The adversary can manipulate the state of the implementation
- Protocol attacks, RNG attacks, ...
- **The adversary is not bounded!!!**

Story time - CSS

- The DVD copy control association wanted to protect DVDs.
 - These are MGM, 20th Century Fox, Warner Bros etc.
 - They have a bit more resources than you, and likely more than your (future) employer
- 1996 – release C
 - Proprietary encry
- Oct. 1999 – DeCSS appears. Pres versus engineering a DVD drive.
 - Uses a 40-bit key. Not entirely CCA's fault, but could be broken in 24 hours using 1999's tech. (A few seconds today.)
- Nov. 1999 – Frank Stevenson releases three exploits
 - Reduce attack to 2^{25} . Can be broken in a few seconds.

Types of ciphers

- Stream ciphers
 - Produce a pseudo-random stream of bits
 - XOR stream of bits with plaintext message to produce ciphertext
- Block ciphers
 - Operate on fixed size blocks
 - SWEET32 attack – ciphers with 64-bit blocks are not secure. Use AES (128-bit blocks).
- Block ciphers are better understood and are used more often

Assignment Project Exam Help

Modes of Operation – ECB

- The block cipher mode of operation specifies how to handle messages longer than a single block.
- Electronic codebook (ECB)
 - Divide message
 - Encrypt each bl

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

ECB is bad

- Identical plaintexts encrypted to identical ciphertexts

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Modes of operation - CBC

- Cipher Block Chaining
 - Before encryption XOR each plaintext block with the previous ciphertext block
 - Use a random Initialisation Vector (IV) for the first block
 - IV does not need to

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

CBC Drawbacks

- Encryption (decryption) is sequential
- Limited ciphertext error propagation
 - Exploited in the POODLE and Lucky 13 attacks

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Modes of operation - CTR

- Turns a block cipher into a stream cipher
 - Generate a sequence of “counter” blocks
 - Typically, a random nonce combined with a sequence number
 - Encrypt each counter block
 - XOR with the ciphertext block
- Supports parallel encryption

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

CTR - Drawbacks

- Malleable – a change in the ciphertext results causes a similar change in the plaintext
- Sensitive to repeated nonces and to an attacker manipulating t

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Modes of operation - Summary

- ECB – not secure. Do not use unless you know what you are doing.
 - Remember the Dunning-Kruger effect
- CBC – most common
- CTR – better performance
- No authentication
- No message integrity
