

Authorisation

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Terminology

- Object – any resource that can be accessed
- Subject – an entity that may try to perform an operation on a resource
- Permission – the right to perform an operation on an object
- Authorisation – managing and enforcing permissions
- Principal – an identity
 - User – a principal that identifies a human
- Authentication – the process of demonstrating that a subject is operating on behalf of a principal

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

The problem

	Principal1	Principal2	Principal3	...	Principal9999
Object1					
Object2					
Object3					
...					
Object9999					

Assignment Project Exam Help

<https://eduassistpro.github.io/>

- Large number of objects (files, folders, etc.)
- Large number of objects (files, folders, other resources)
- Need an efficient way to represent this
 - Efficient both for management and for enforcement

Grouping

- Treat groups of principals or objects uniformly
- Example – a web site has the following groups:
 - Anonymous users
 - Logged-in user
 - Administrators
 - Operators
- Reduces management complexity
- Often reduces enforcement complexity

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Example: Linux

- Principals: User and group IDs
- Subjects: Processes
- Each process is associated with several gids

```
uid=1000(yval)  
groups=1000(yval), 4(adm), 24(cd  
v), 108(lpadmin), 124(sambashare)
```

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Linux File Permissions

- File permissions:

```
-rwxr-xr-x  1 root  wheel  38624 15 Jul 13:59 /bin/ls
```

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Linux File Permissions

- File permissions:

```
-rwxr-xr-x  1 root  wheel  38624  15 Jul  13:59  /bin/ls
```

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Linux File Permissions

- File permissions:

`-rwxr-xr-x 1 root wheel 38624 15 Jul 13:59 /bin/ls`

↑ ↑ ↑
Owner Group

Assignment Project Exam Help

<https://eduassistpro.github.io/>

- Discretionary Access C

Add WeChat [edu_assist_pro](#)

- Users can assign permissions to `wn`
- Root user (uid 0) can override all permissions

Linux Directory Permissions

- Directory permissions:

```
-rwxr-xr-x 1 root wheel 38624 15 Jul 13:59 /usr/lib
```

Assignment Project Exam Help

Owner

Group

<https://eduassistpro.github.io/>

- What do the permissions mean in the context of directories?

Add WeChat edu_assist_pro

- R - read - list files in a directory
- W - write - create, link or unlink files in a directory
- X - search - use the directory as part of a path

Access Control List

- List of principals and their permissions for each object
- In Linux – extends file permissions:

```
[root@Maui ~]# getfacl /home/foo/docs/foo.txt
getfacl: Removing leading '/' from absolute path names
# file: home/foo/
# owner: jane
# group: executives
user:: r--
user:bob:rw-
user:joe:rwx
group:sales:rwx
group::r--
mask::rwx
other:---
```

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Capability-based access control

- Specify the objects and permissions for each subject
- Linux open file descriptors
 - Capabilities for
- Linux Capabilities
 - Assigns to the root user. Examples:
 - CAP_DAC_READ_SEARCH – Bypass file read permission checks
 - CAP_DAC_OVERRIDE – Bypass file RWX permission checks
 - CAP_FOWNER – Bypass file ownership checks

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Lattice-based access control

- A.k.a label-based access control, rule-based access control
- Associates ~~Assignment Project Extension Help~~ objects with partially ordered labels
- Determine per <https://eduassistpro.github.io/> labels
- Military people love it [Add WeChat edu_assist_pro](#)
 - Users with 'confidential' label cannot access 'top-secret' documents

Role-based access control

- Extension of grouping – a *role* is another type of principals
- Subjects assigned to roles
- At each time a role
- Access rights de
- Can be implemented using an mechanisms
- Example:
 - selinux uses special ACLs for role-based file access

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Implementation issues

- Aim for a unified authorisation check

```
int checkperm(subject, object, permission)
```

- May vary depending on the application!

Assignment Project Exam Help

- Check permission <https://eduassistpro.github.io/>

- Do not access if there is no p [Add WeChat edu_assist_pro](#)

- Consider the level of information to report in case of access denial

TOCTOU

- Authorisation check before every operation may not be enough
 - State may change between check and operation

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

CVE-2008-2958

```
TMP_DIR=${BASE_TMP_DIR}/`awk 'BEGIN { srand();  
  for(i=1;i<22;i++) {  
    a=95;  
    while (a > 90 && a < 97 {  
      a=65+int(50*rand())  
    };  
    printf("%c", a  
  } }`
```

- Debug User
Add WeChat edu_assist_pro
- Change resource limits Soft – user, increase hard – root
- Change security context Complex

Changing privileges

- `setuid()` – sets the uid of the running process
 - Unrestricted use – only root
- Setuid executable – when executed get the uid of the owner
 - Can use `setuid()` to change between effective and real user ids.
 - Use: `sudo` – why not login?
- Capabilities – Fine grained privilege escalation

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat `edu_assist_pro`

Why capabilities

- Send raw packets

Root

- How do we implement ping?
- Setuid binary w <https://eduassistpro.github.io/> restricted access
- Capabilities only allow breach network guarantees

Add WeChat edu_assist_pro

Bootstrapping

- First process created with uid=0 (root)
- It creates multiple processes, including a login server
- The login server creates a login process when a user connects
- Login process authenticates
- Login process sets the userid and executes the shell.

henticated

Privilege Separation

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Problem description

- Programs often need to run with high privileges
- But at the same time they need to perform a large number of non-privileged operations
- Any bug in the program can give elevated privileges to an attacker

Assignment Project Exams Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Example - SSH

- SSH server – listens for connections
 - Runs as root. Why?
- When the server receives a connection it for
- ... creating a login
- After authentication the login process drops privileges, becoming the login shell

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Example - SSH

- SSH server – listens for connections

- Runs

- When a connection is received

- ... creates a process

- After

process drops privileges, becoming the login shell

Privileged process handling user input

SSH server

SSH login process

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Privilege separation

- Break the software into two processes – a privileged monitor and an unprivileged slave
- The slave does <https://eduassistpro.github.io/>
- The monitor performs operations on behalf of the slave [Add WeChat edu_assist_pro](#)

... In OpenSSH

- SSH Server creates login monitor
- Which creates the unprivileged slave
- The unprivileged slave authenticates the user
- And instructs the monitor to create the login shell

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

Finer points

- Slave and monitor use IPC mechanisms to communicate
 - Socketpair for all information requests from the slave
 - Shared memory between the slave to the login process
- A state machine traces which actions are expected
- The unprivileged slave runs in a chrooted environment

Add WeChat edu_assist_pro

<http://www.peter.honeyman.org/u/provos/papers/privsep.pdf>

Chroot

- `chroot("/foo")` changes the root of the file system for the process to `"/foo"`
- Prevents access to files outside `"/foo"`
- In practice, two things are needed:
 - The directory `"/foo"` must exist
 - The meaning of the file `".."` must be resolved in `"/foo"`
- Only the root user can use `chroot()`. Why?

Assignment Project Extra Help

<https://eduassistpro.github.io/>

Add WeChat [edu_assist_pro](#)

Linux containers

- Extends chroot environment to create multiple namespaces
- Create a mapping of all the system identifiers
- Containers have process ids, etc

Assignment Project External Help
